

ADRV9029 DPD results with QORVO PA Part No: QPA4605

ADRV9029 Evaluation Board with on-chip Digital Predistortion Solution

Introduction:

In this report, we present DPD results using the ADRV9029 on-chip DPD using the following setup configuration:

User Case: 51C_Non-LinkSharing

Sampling rate: 245.76Msps

JESD Lane rate: 16.22016Gbps

DFE (CFR ,DPD): Enabled

LOL correction: Enabled

QORVO PA test conditions

Transceiver	ADRV9029
Power Amplifier	QPA4605
Driver Amplifier	MINI Circuits ZVA 183-S+
Application	M-MIMO
Output power	37 dBm (5 Watt)
PA Type	GaN
Frequency Range	4500-4600 MHz
Gain	25.4 dB
Drain Efficiency %	37.2%
Bandwidth Tested	5GNR 100MHz
ACLR	-52 dBc
Supply Voltage	48V

Test setup

Note: The reports published are measurements done on single PA using ADI test environment. that there can be slight DPD performance difference due to part-to-part variations. PA vendors might release other versions of this same EVB with enhanced efficiency and linearity performance. Also, using a custom PA design based on this PA part number may results in different DPD performance.

The Driver amplifier used in Fig. 1 is broadband QORVO QPA4605. Customers may use different components in their DPD setups. However, careful component selection needs to be performed in order to be able to reproduce the DPD results published in this report.

In Fig. 1, the GaN Amplifier QPA4605 is loaded with high power attenuator presenting a max VSWR of 1.15 to not detune the PA from its optimum tuning.

We encourage our customers to evaluate the ADRV9029 DPD performance using evaluation board using the test conditions in this report. It is important to start by testing the evaluation board provided by the PA vendor with the recommended bias values and duplicate the DPD results in this report before proceeding with the custom PA design.

Summary

QPA4605 test conditions are:

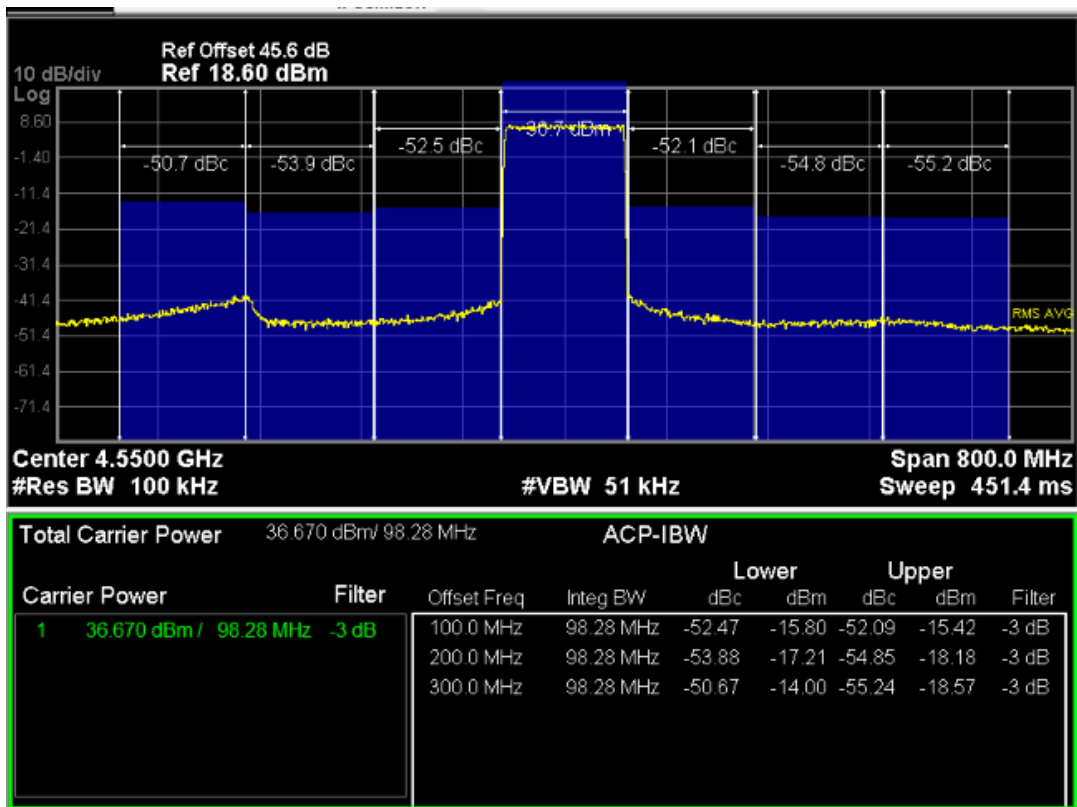

- Center Frequency: 4550 MHz
- Efficiency: 37.2%
- Average Output Power: 36.5 dBm (4.47 Watt)
- Test signal: 5G-NR 100MHz

Test Results

Case 1: Test Signal 5G-NR 100MHz (PAR = 8dB), Output Power: 36.5 dBm, Band:4550MHz,

Bias conditions: Vcc= 48V, Vref = 5V, Idq=40mA, Vg_carr1=-2.49V, Vg_carr2=-3.83V

Post DPD results:

Conclusion

- The ADRV9029 on-chip, with DPD and CFR engines enabled, power consumption estimate is around 5.8 W in TDD mode. The power consumption can be reduced by lowering the sampling speed and saving JESD resources. Using the Zero IF architecture with an operating bandwidth of 200MHz, the ADRV2029 consumes lower power when compared to RFDAC transceiver architecture solutions.
